

The local ENECON Ibérica Fluid Flow Systems Specialist was contacted to help find a solution to this erosion problem.

thin which reportedly

resulted in loss of power.

He recommended that METALCLAD CeramAlloy CP+AC be used to rebuild the turbine blades. Two coats of METALCALD CeramAlloy CL+AC were then used to help protect the turbine blades from future erosion damage.

**MT-084** 

This turbine rotates at approximately 1,000 rpm. Now after 5 years the plant engineers have reported no further erosion or loss of power on this turbine.

Needless to say, they are very, very satisfied with this CeramAlloy application.
