

ENESEAL Saves Chemical Company's Metal Roof!

The director of maintenance at this major chemical company in western Pennsylvania was very concerned about the remaining life expectancy of this metal roof which was about 50% covered with rust. The cost of replacing this roof in the next few years was not in the budget.

After learning about the advantages of **ENECON's ENESEAL HR**, the maintenance director decided that it was better to pay a little now instead of very much more later.

The roof was first pressure washed and a rust inhibiting primer, supplied by the plant, was

applied to the roof surface. Two coats of ENESEAL HR were then applied by airless spray over the entire roof area.

The ENESEAL not only eliminated the rusting problem; it also sealed numerous pinholes in the roof, lowered the ambient temperature in the

building during the hot summer months, and greatly enhanced the image of the building.

It essentially looks as if they replaced the roof, without the large cash outlay!
